No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ٠.

```

```
This is the human heregulin 2 (Her2) sequence. Immunogenic analogue, Her2 can be used in the claimed method as an autovaccine to induce a response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. Regions suitable for the insertion of foreign helper epitopes were identified (see features table). The method
                                                                               Inducing peptide a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (PGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respectip PA and including at least one foreign T helper epitope are also claimed The method is used to treat prostate, prostate/breast or breast cancer when the DA is human PSM.

Novel synthetic therapeutic compound for inducing immune response for use in adoptive immunotherapy, has enhanced binding to major histocompatibility molecules and enhanced immunoregulatory propert nanced binding to major immunoregulatory properties

Claim 4 Page 63-67; 69pp; English

peptides) with enhanced binding to major histocompatibility complex (MHC) molecules and enhanced immunoregulatory properties relative to their natural counterparts. Compounds of the invention are useful communoregulatory properties relative to their natural counterparts. Compounds of the invention are useful communorherapy. They are useful as components of anti-cancer vaccines immunorherapy. They are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancers characterised by expression of the breast cancer antigen, HER-2. Compuncleotides that encode peptides of the invention are useful as hybridisation probes and as primers for the detection of genes of gene transcripts that are expressed in antigen presenting cells (APCs), to confirm transduction of polymucleotides into host cells. The present gequence is human tyrosine kinase-type receptor, HER-2. Compounds of the invention are designed based on the HER-2 antigenic peptide (774 - 782).

Treating tumors, particularly breast cancers, receptor and does not respond to an anti-ErbB conjugating the antibody to a maytansinoid which overexpress an antibody, comprises

Example 3; Fig 4; 92pp; English.

The present invention provides a method of treating cancer by administering a conjugate of anti-ErbB antibody with a maytansinoid. particular, the antibody is directed against ErbB2 (also known as HER and pl85neu). The method is particularly useful in the treatment of breast, ovarian, stomach, endometrial, salivary gland, lung, kidney, colon, colorectal, thyroid, pancreatic, prostate and bladder cancers. HER2

```

growth

The invention relates to treating a tumour in a mammal, where the tumour is characterised by the overexpression of an epidermal growth factor receptor (ErbB) and does not respond or responds poorly, to treatment with an anti-ErbB antibody, comprising administering to the mammal an anti-ErbB antibody-maytansinoid conjugate. The method is useful for treating cancer or tumours of the breast ovary, stomach, endometrium, salivary gland, lung, kidney, colon, colorectum, thyroid, pancreas, prostate and bladder, preferably breast cancer. The breast cancer is a metastatic breast cancer or an aggressive form of metastatic breast cancer which overexpresses ErbB2. The method is also useful for treating neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, epithelial, stromal, blastocoelic, inflammatory, angiogenic and immunological disorders. This sequence represents the human HER2 (ErbB2) polypeptide of the invention.

The protein is over-expressed in various cancers, including breast, ovarian, colon, lung and prostate. The intracellular domain of the protein can be used to immunise an animal against a malignancy with which the oncogene is associated. The polypeptide can be produced in transformed host cells for use in immunisation. Alternatively, animal cells are transfected in vivo or ex vivo with a viral vector that directs expression of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA encoding HER-2-neu poly:peptide(8) - treatment of malignancies with which the

                       This sequence represents the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.

```

The present sequence is the human HER-2/neu protein. It is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against these neoplasias. is a member of

```
protein has an in-frame deletion of 16 amino acids, 2 of which are conserved cysteine residues, compared to the unspliced protein. The erbB-2 polynucleotide is used to construct probes for detecting disorders of cell transformation such as cancer. Antibodies to the protein may be used to detect SPLICE erbB-2 in a sample. Agents (e.g. antisense oligonucleotides) which inhibit the expression of SPLICE erbB-2 are useful for reducing tumor cell proliferation and treating cancer. Substances which stimulate SPLICE erbB-2 are useful for treating conditions involving damaged cells including conditions in which degeneration of tissue occurs, such as arthropathy, bone resorption, inflammatory diseases, degenerative disorders of the central nervous system and wound healing.
                                                                                                                                                                                                                                                                                                                  Claim 3;

New antigen-presenting cells, useful as vaccines for eliciting enhancing an immune response to HER-2/neu protein, particularly for treating or preventing cancer, e.g. breast cancer Cheever MA, 2001-476112/51 Hand-Zimmermann

or y useful

Claim <u>ې</u> Page 41-46; 49pp; English

The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/neu protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/neu protein, particularly in treating or preventing malignancies in which the HER-2/neu oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents the human HER-2/neu protein (also known as p185 or c-erbB2). 'n

An isolated prepared HER2/new epitope useful in a vaccine for cellular immune responses for the prevention and treatment of English cinducing cancer -

The present invention describes isolated prepared HER2/neu epitopes (I). CC Also described are: (I) a clonal cytoroxic T lymphocyte (CTL) that is CC culture in vitro and binds to a complex of an epitope (I), bound to a CC human leukocyte antigen (HLA) molecule; (2) a peptide (II) comprising (I) CC and a second epitope and the peptide is less than 50 contiguous amino CC acids that have 100% identity with a native peptide sequence of HER2/neu; (CI) and (SI) an isolated nucleic acid encoding a peptide comprising (I) excipient; (4) an isolated nucleic acid encoding a peptide comprising (CI); and (SI) are useful for inducing cellular immune responses for the prevention and treatment of cancer. (I) and (II) are useful for comprising (CI) and (III) are useful for inducing cellular immune responses for the detecting the presence of bound T lymphocyte to a tumour associated antigen when incubated with a T lymphocyte to (I) or (II). Epitope chased vaccines mean that immunosuppressive epitopes that may be present in whole antigens may be avoided. Selected epitopes may be combined to combine immune response to multiple tumour associated molecules and focus an immune response to multiple tumour associated molecules addressing the problem of tumour variability and reducing the likelihood of tumour variability and reducing the likelihood of tumour easape due to the exemplification of the present invention.

Novel antisense oligonucleotide which modulates the Epidermal Growth Factor receptor, Her2, is useful for inflammation or to prevent infection in humans he expression for treating of Human

Example 13; Page 95-107; 116pp; English.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding Her2 (human Epidermal Growth Factor receptor 2) that specifically hybridises with and inhibits the expression of Her2. Antisense compounds of the invention are used for treating diseases or conditions associated with Her2 such as hyperproliferative disorders e.g. lung, breast, gastric, oesophageal, colon, bladder, salivary, neural or cardiac cancer. They are also useful prophylactically e.g. to prevent or delay infection, inflammation and tumour formation. The invention is also used in gene therapy. The present sequence is human

The invention relates to an isolated Her-2/Neu polypeptide composition CC effective for eliciting an immune response. The invention is useful for CC eliciting an immune response in a patient, where the patient is human CC leukocyte antigen (HLA)-844 positive or is affected with breast cancer. CC preferably breast cancer, in pharmaceutical compositions, e.g., vaccine CC and other compositions for the diagnosis, prevention and treatment of the compositions for the diagnosis, prevention and treatment of CC human malignancies, for stimulating and/or expanding T cells specific for CC Her-2/Neu polypeptide and for inhibiting the development of cancer in a CC patient. The invention is useful for stimulating a T cell response in a CC human patient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the CC entire Her-2/Neu gene or gene fragments of interest, to isolate a full CC polypeptide in appropriate host cells. The composition is useful in CC prophylactic or therapeutic applications and for the treatment of cancer, CC preferably for the immunotherapy of breast cancer and other Her-2/Neu-creations. The invention is useful in gene therapy. The

```
The present sequence is that of human Her-2/neu (p185 glycoprotein CC or c-erb87), an oncogenic self-protein and target for anti-cancer vaccines. The Her-2/neu igene is amplified and p185 is overexpressed CC in a variety of cancers, including breast, ovarian, colon, lung and CC prostate cancer. Her-2/neu is a member of the tyrosine kinase CC family of receptor-like glycoproteins. It comprises an extracellular domain with homology to the epidermal growth factor receptor (EGFR), a highly hydrophobic transmembrane domain and a C-terminal CC intracellular domain that also shows homology to EGFR. Its overexpression correlates with a poor prognosis in breast and CC overexpression correlates with a poor prognosis in breast and CC overexpression correlates with a poor prognosis in breast and CC overexpression mucleic acids encoding them, viral vectors, and vaccines CC comprising the fusion proteins or nucleic acid molecules. In CC preferred fusion proteins or nucleic acid molecules. In CC protein is fused to a Her-2/neu intracellular domain or CC protein is fused to a Her-2/neu intracellular domain or CC protein is fused to a Her-2/neu intracellular domain or CC protein is the fusion protein in the form of a vaccine, or by CC transfecting cells of an animal ex vivo with a nucleic acid cells co the animal. The fusion proteins, nucleic acids, and isolated CC encoding the fusion protein, and delivering the transfected cells co the animal. The fusion proteins, nucleic acids, and isolated CC ancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu CC order to inhibit the development of cancer in a patient.

                                                                                                                        The invention relates to a method for inhibiting development of haematological malignancy in a patient by administering a polypeptide comprising an immunogenic portion of Her-2/neu or a polynucleotide encoding the polypeptide. Antigen presenting cells that express the protein can also be administered. The sequences are used for inhibiting development of haematological malignancy such as acute myelogenous leukaemia (AML), chronic myelogenous leukaemia (CML), mDS, myelomas, Hodgkin's lymphoma and non-Hodgkin's lymphoma. This sequence represents the human Her-2/neu polypeptide.
                                                                                                                                                                                                                                                          Disclosure; Page 71-74; 74pp; English.
                                                                                                                                                                                                                                                                                    Inhibiting haematological malignancy development by administering polypeptide comprising immunogenic portion of Her-2/neu, polynucleotide encoding the polypeptide, or antigen presenting cells expressing the polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Her-2/neu; cytostatic; haematological malignancy; CML; acute myelogenous leukaemia; AML; chronic myelogenous leukaemia; chronic lymphocytic leukaemia; myeloma; non-Hodgkin's lymphoma; Hodgkin's lymphoma;
                                                                                                       Sequence

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
